

SARABIAN FARMS

TREATMENT OF GREEN BEAN FIELDS UNDER THE INFLUENCE OF **TERRABELLA®**

- Product User: Sarabian Farms, Sanger, CA
- Issue: Green bean farm looking to increase crop yield.
- Treatment Date: August 2010
- Treatment: Standard two-stage **TerraBella®** application to test plot containing 10 rows of beans. Control plot of the same size was identically planted and maintained.
- Treatment Result: **Yield:** treated plot produced 23% more total beans than the control plot.
- ROI:** Considering the cost of the **TerraBella®**, the sales price of the green beans, and the 23% yield increase, Sarabian's return on investment was 179%.
- Incremental Benefits: After the green bean harvest, the same plot was used for cucumbers with a notably longer growing season and greater (though not precisely measured) yield from the treated plot.

The following table shows the detailed results of these tests.

	<u>Control</u> <u>Bed</u>	<u>Treated</u> <u>Bed</u>
30# Boxes of Beans	312	384
Total Beans Percentage Increase		23%

Green beans were collected and weighed by Sarabian employees.
